PROFESSIONAL SUMMARY

Senior Software Engineer with expertise in and enthusiasm for enterprise platform engineering, multi-tenant SaaS (Software as a Service), microservices, event-driven and serverless architectures, DevOps principles and best practices, and user-centric design principles and practices, craves crafting cloud native solutions in a collaborative, and creative culture.

Core Features:

- ⇒ Curiosity for systems and automation and rooting out inefficiencies, miscommunications, and inaccuracies.
- ⇒ Passion for DevOps, enhancing CI/CD pipelines, reducing deployment times, and improving system interoperability.
- ⇒ Strives for automation whenever possible and executes strategy toward increased efficiency when it is not.
- ⇒ Practices present and focused leadership, promoting collaborative team cultures and growth-based mindset.
- ⇒ Evangelizes innovation and promotes collaboration across an organization and its customers.
- ⇒ Initiates and drives cross-functional initiatives to streamline operations, increase system performance, and facilitate rapid product onboarding and adoption.
- ⇒ Committed to lifelong learning and strives for mastery of software paradigms, architecture, and tools.
- ⇒ Values transparency in thought and action and takes ownership of and responsibility for work and actions.

Education

Saint Joseph's University

M.S., Computer Science
Philadelphia, Pa
2012-2014

Art Institute of Pittsburgh

B.S. in Graphic Design
Pittsburgh, PA
2006-2010

Technical Skills

Languages	Java, Python3, JavaScript, TypeScript, C, C++, COBOL, Assembly
Front End	HTML, CSS + JavaScript, Frameworks (React, Angular2), responsiveness, CSS pre-processors, testing, optimization
Back End	Spring, Django, DBMS, APIs, serverless, containerization, orchestration, cloud tooling (Azure, AWS), Event architecture
Testing	Automation tooling (Selenium, JMeter), Unit test libraries (Jest, Karma, Junit, React Testing Framework), E2E (Cypress)
Data	MySQL, PostgreSQL, SQL, MongoDB, Azure Data Lake, Snowflake, Jupyter Notebook, NumPy, Pandas, Dataframes
Monitoring	ELK Stack (Elasticsearch, Logstash, Kibana), Prometheus, Grafana
DevOps	Docker, Kubernetes, Git, Git Actions, CI/CD, IaC (Terraform), version control, Configuration tooling (Yaml, Ansible), SDLC
Cloud	Azure, AWS, GCP

CAREER EXPERIENCE

Blue Yonder 🍀 *Senior Software Engineer*

Coppell, TX (*Remote/Hybrid*)

mar 2020 - dec 2024

- ⇒ Key player in evolving the Platform from a data pipeline with authentication to a fully realized, multi-tenant enterprise SaaS Logistics platform offering multiple logistics solutions and allowing custom package configurations for customers.
- ⇒ Contributed cross-functionally to unite and evolve aspects of the platform including identity & access management, runtime/hosting services, portal services, meta-model programming, and data pipelines, while acting as TPM (Technical Program Manager) under the supervision of Platform executive leadership.
- ⇒ Individual Contributor and Senior Software Engineer on various scrum teams organized along vertical slices of distributed architecture, including meta-model services, streaming pipeline services, and portal shell services.

PORTAL SERVICES

Development and maintenance of portal shell services as MFE (multi-frontend) container for multi-tenant SaaS enterprise logistics platform UI.

- ◇ Built and maintained platform portal shell service as **micro-frontend (MFE)** using **React with Typescript SPA (single page application)**, integrating authentication and authorization with per-tenant role management via **Azure AD B2C**.
- ◇ Implemented an **RBAC-enforced** navigation menu dynamically producing workspace features according to tenant specifications, using **Composite and Strategy patterns** to design implementation and enforcing **RBAC** (role-based access control) through a custom **Rules Engine** (interpreting role and permission token data against role definitions).
- ◇ Facilitated **CI/CD** infrastructure using **GitHub Actions** to continuously deploy from main branch (automatic push and deployment to phased environments on pull request approval) and **Terraform** to dynamically deploy infrastructure at runtime, supporting multi-tenant infrastructure through parameterized Terraform modules, spinning up tenant-specific resource modules and deploying global resources (e.g., **Resource Groups, Key Vaults, Storage Accounts, CDN endpoints, monitoring alerts, feature flag** implementations).

DATA SERVICES

Design, development and maintenance of streaming data pipeline for real-time data transactions.

- ◇ Designed and implemented **event-driven service** in **Apache Kafka** to process real-time data and support microservices architecture of the platform, promoting loosely coupled components, event-driven workflows and independently scaled services. Used **topics** and **consumer groups** to ensure parallel processing of system transactions.
- ◇ Orchestrated and managed **Kubernetes clusters** for **containerized applications**, using **Docker** to containerize and deploy across multi-phased environments, ensuring efficient resource management and high availability. **Helm charts** used to manage and deploy streaming pipeline microservices for simplified versioning, easy rollbacks, and hot patch updates, ensuring consistency across multi-environment setup.
- ◇ Designed and developed **microservices** in **Java / Spring Boot**, using advanced Java version features like **streams** and **lambdas**, **virtual threads**, and **record** patterns. Wrote robust unit and integration tests using testing frameworks like **Junit**, **TestNG**, and **Spring test**. Incorporated **JSON**-processing, logging, and **ORM** mapping libraries. Managed high volumes of data in SQL and NoSQL databases (**PostgreSQL**, **Cassandra**) data warehouses (**Snowflake**), and **ELK** (Elasticsearch, Kibana & Logstash).

TECHNICAL PROJECT MANAGEMENT

Management of cross-cutting technology projects requiring technical expertise and leadership.

- ◇ Led cross-functional initiatives for Product Development, effectively obtaining buy-in from **stakeholders**, including **product owners**, **project managers**, and **executives**, ensuring alignment with business goals and securing necessary resources for successful project execution and delivery.
- ◇ Coordinated cross-organizational release management, collaborating with key players from multiple areas of Product Development and Operations to architect, organize and build coordinated **infrastructure environments** for planning

and release coordination based on **SAFE** (*Scaled Agile Framework*), resulting in a significant increase in developer productivity, better requirements definitions for developer stories, and improved sales to product implementation results.

- ◇ Facilitated clear and efficient communication between siloed experts from diverse areas of the organization. Drove discussions and documented them, asked probing questions, kept a decision record, and published notes and documentation to SharePoint and Confluence, managing both sites for project participants. Multi-layered complexity was involved and had to be coordinated on a tightly enforced roll-out schedule.

META MODEL PROGRAMMING

Development and maintenance of services driven by the platform meta model as an abstraction of system structure, behavior, relationships, et.al.

- ◇ Created Web UI using **Angular 2** demonstrating the proprietary metamodel and deployed it to an on-prem server and available for use by Project Managers and Software Engineers throughout Product Development.
- ◇ Developed and maintained software development tools and tasks driven by the meta-model (**Model-Driven Engineering**).

Core Logic ♣ *Software Engineer*

Coppell, TX

may 2019 – feb 2020

Extreme programming lab engineer for largest data broker specializing in real estate, building full stack solutions using Angular 2 with Java/Spring Boot.

- ◇ Designed, implemented and maintained application for automation of escrow payments, simplifying processes for customers (financial institutions, banks, etc.), by calculating disbursement and generating checks.
- ◇ Enhanced deployment stability and efficiency, reducing release times and improving software quality.
- ◇ Fostered strong cross-department collaboration, ensuring project success and adhering to stringent deadlines.

Choptank Transport ♣ *Software Engineer*

Preston, MD

aug 2016 – mar 2019

Founding team member leading greenfield implementation of CRM (Customer Relationship Management) in Node.js with Express + RESTful APIs,

- ◇ Reduced manual processes by 20% and increased software scalability to handle higher transaction volumes with minimal latency.
- ◇ Designed and implemented Angular-based dynamic web interfaces, ensuring real-time, responsive UIs for users while integrating seamlessly with backend services and APIs, to provide a consistent, smooth user experience.
- ◇ Designed and Implemented CTI (computer-telephony integration) subsystem for Avaya Office IP/TSAPI creating a Java TSAPI adapter that abstracted away binary CSTA complexity to connect with phone system, listen events (calls), and exposed a simple REST/WebSocket façade for which the CRM to subscribe.

Highmark Blue Cross Blue Shield ♣ *Software Engineer*

Wilmington, DE

jan 2015 – aug 2016

Maintained and enhanced critical healthcare operations applications on IBM mainframe systems (z/OS, COBOL, JCL).

- ◇ Improved operational stability of legacy systems, ensuring continuous support for critical healthcare operations.
- ◇ Addressed and resolved high-priority issues, improving system stability and data integrity through diligent debugging and enhancements.
- ◇ Enhanced data integrity and system reliability by resolving complex software issues, leading to more dependable healthcare service delivery.

Key Projects

Full library of project work can be found at my [GitHub portfolio](#) or through my [portfolio site](#).

Stitch Companion

Cross-stitch pattern generator built using React with Python, and Jupyter Notebook.

Device Management System

Chore-reward app for families built using React, Spring Boot, PostgreSQL, and ML models.

Portfolio Site ([k8port.dev](#))

Personal portfolio built with Next.js, TypeScript, and Tailwind CSS and showcasing professional projects.

Human Essentials

Opensource inventory management system for supply banks, enabling better tracking and reporting and built with Ruby, JavaScript, and Docker to deliver a scalable solution for nonprofit organizations.
